

AR Based Dragon Game

It is an AR based game that scans the real time environment and then spawns the dragon in your environment . You can play the game by the help of a joystick that is provided in the bottom right of the screen. The dragon can move in the real realm and follows the commands by the joystick.

This game is developed in the unity engine and by the help of C# programming. Priorly it is required to install all AR packages for the functioning of AR app .

In this i donot used the main camera , instead of i had switched to AR Session origin which priorly equipped with the camera o set.

Rest are only the coding part of the app and the scene setting of AR .

I had used the dragon and joystick asset that is freely available in the unity asset store. And can be imported by the package manager.

You can develop your own custom avtar in

1. Ready player Me
2. Mixamo

NOTE : As these project is of my internship at CSIR CSIO I cannot give full code and descriptions due to confidentiality reasonsbut I can show demo during interview on my device.
