

MR Based Furniture App

It is a mixed reality app , as by name we can manipulate the spawned objects according to our need named as "AR FURNISH" . It scans the real world environment of yours and enables you to spawn virtual prefabs (product copy) of the furniture and enables you try out various furniture objects at your place before actually buying it .

This app is solely developed in unity game engine and with the help of some AR packages like Vuforia Engine and AR Foundations.

In this I had fed few of the furniture virtual copies that are downloaded from various platforms you can make your custom prefabs in the applications like blender and draw.io tools.

You can drag the objects to the different location , rotate , and scale the objects according to your need and try it before actually buying it.

I had provided the menu bar to display the objects that is being selected at the movement.

Two buttons namely Back and Next to shuffle between the list of the objects.

Here are some of the images that display the app visually.

NOTE : As these project is of my internship at CSIR CSIO
I cannot give full code and descriptions due to
confidentiality reasons but I can show demo during
interview on my device.
